**Key Features**
- Standalone IEEE 1588 Precision Time Protocol Boundary Clock
- Flexible PTP profiles to support both frequency and phase synchronization
- Designed to support the future ITU-T G.8275.2 profile for phase synchronization
- Support for 8 to 64 PTP clients
- Gigabit Ethernet interfaces
- Synchronous Ethernet
- E1/T1, input or output
- 10 MHz, PPS and TOD output
- DC or AC power models
- Local and remote CLI, web interface, SNMP traps
- TimePictra Synchronization Management System support

**Key Benefits**
- Sync solution for the mobile network edge: 4G/LTE and small cells
- No change out or upgrade of network hardware
- Mitigates impact of backhaul noise, packet delay variation and load asymmetry
- Synchronization protection for high network availability
- Preserves current MPLS network engineering

**Major Applications**
- LTE-FDD, LTE-TDD, LTE-A networks
- Ethernet backhaul networks

The Symmetricom® TimeProvider® 2300 is an advanced, standalone IEEE 1588 Precision Time Protocol [PTP] Boundary Clock optimized to enable deployment of small cells and meet the stringent timing and synchronization requirements of 4G/LTE networks. It is designed for deployment at selected locations in the backhaul network following the approach anticipated in the proposed ITU-T G.8275.2 standard for partial on-path support. This approach enables timing from a centrally located grandmaster to be maintained over currently deployed network equipment—eliminating the need to upgrade every element to include a PTP boundary clock function.

This “synchronization overlay” solution is made possible by features not typically found in integrated boundary clock designs. Using Symmetricom’s advanced PTP client software and adaptive timing calculations, these capabilities include superior clock recovery algorithms that determine the best timestamps on which to base the offset calculation, the ability to mitigate for timing impairments, faster clock recovery times, the ability to adapt for load asymmetry, and the ability to leverage frequency input from SyncE or T1/E1 signals. The TimeProvider 2300 also offers the opportunity to upgrade the reference oscillator to extend the holdover time in the event input signals are lost.

TimeProvider 2300 supports from 8 to 64 PTP clients, and offers additional output capabilities that allow it to support legacy frequency timing applications, including E1/T1, 10 MHz, pulse per second (PPS) and time of day (TOD). When deployed in an end to end network with Symmetricom’s TimeProvider 5000 PTP Grandmaster and TimePictra® Synchronization Management System, carriers can also benefit from superior monitoring information and management capabilities.

**Edge Master Clocks**

The continuing evolution of mobile network technologies has driven the need for increased accuracy and greater availability of timing and synchronization signals. At the same time, backhaul networks with high packet delay variation present timing “jitter variation” and asymmetry challenges that are difficult to solve with current solutions. Furthermore, deploying a GNSS receiver at every location is impractical, particularly in many small cell environments. Together, these issues create the need for a new overall Synchronization Distribution Architecture for LTE networks.

**Edge Master clocks** are PTP synchronization equipment designed for deployment in current networks by locating a grandmaster at or near the edge or by overlaying the network with advanced boundary clocks at designed locations. They enable mobile network transitions to include small cells, and they support the stringent LTE-TDD and LTE-A phase and time requirements without overhauling the current backhaul network. In frequency synchronized networks (LTE-FDD, as well as 2G/3G), Edge Master equipment can be deployed to eliminate timing issues caused by diverse technologies in the backhaul network, high packet delay variations, and asymmetry inherent in Carrier Ethernet networks.

The TimeProvider 2300 is an advanced standalone PTP boundary clock for deployment at planned locations to support precision time distribution over Ethernet backhaul networks. Also included in the Edge Master category, Symmetricom’s TimeProvider 2700 is a PTP grandmaster deployed at or near the edge of the network. Together, Edge Master products enable synchronization distribution solutions that allow the mobile network to continue to evolve without retrofit of existing backhaul equipment and without changes to current network design and switching/routing policies.
Meeting Stringent Synchronization Accuracy Requirements

Synchronization accuracy requirements have gone from relatively routine frequency specifications (16 ppb on the network side, 50 ppb for the air interface) to more stringent time and phase requirements as tight as ±5 µsec or even ±1.5 µsec in some of the proposals under discussion in the standards bodies. Global Navigation Satellite System (GNSS) receivers co-deployed or integrated into the mobile base stations are not always a feasible solution for either technical or economic reasons (satellite visibility and antenna deployment costs for example). Primary Reference Time Clock performance, specified by ITU-T G.8272, meets the accuracy requirements using a GNSS signal (GPS or GLONASS) as a reference, and the IEEE 1588 Precision Time Protocol can deliver the needed accuracy under the right conditions. However backhaul networks with many hops and asymmetric paths between the grandmaster and the PTP client, or networks with multiple transport technologies, or those with high packet delay variation due to loading or other issues, cannot be sure to consistently meet the required specifications.

One solution is to upgrade the backhaul network for Synchronous Ethernet and include a PTP boundary clock in every transport element. This is the approach proposed in ITU-T G.8275.1, currently a work in progress by the ITU-T. This solution requires that every network element between the grandmaster and the client support Synchronous Ethernet and include a boundary clock function—a solution that is not always feasible due to the high cost to upgrade a network or because the mobile carrier employs 3rd party networks for backhaul. Furthermore, operating at Ethernet Layer 2, G.8275.1 may obsolete or conflict with the current MPLS network design and provisioning policies of the current backhaul network.

A better solution is to deploy an Edge Master class of product, using the approach proposed in G.8275.2. Figure 1 depicts TimeProvider 2300 deployments at planned locations. This deployment mitigates or eliminates issues introduced by the performance of the backhaul, and therefore, makes unnecessary the need to upgrade the entire backhaul network to include boundary clocks in every network element. Operating over existing networks at Layer 3, this solution also preserves current MPLS and other network provisioning policies and engineering practices, and it is compatible with and leverages previous investment in using the G.8265.1 profile (and pre-standard profile) for frequency synchronization.

Figure 1: Synchronization overlay using advanced PTP boundary clocks.

TimeProvider 2300 Boundary Clocks are deployed in engineered locations to support accurate time delivery across the backhaul network, or where GNSS is either not available (urban canyons, subways) or not practical to deploy. The Symmetricom TimeProvider 5000 and TimeProvider 2700 Grandmaster clocks integrate G.8272 compliant Primary Reference Time Clock capability.

Rubidium oscillators, either in the base stations or the PTP Edge Master Clock, extend the holdover period when the primary reference is lost. In the boundary clock, investment in the high grade oscillator is leveraged across multiple base stations.

The TimePictra Synchronization Management System provides remote management of the synchronization equipment and visibility of all PTP clients.
Integrated GNSS receivers are a viable alternative for timing of macro eNodeB equipment, though operations would still be jeopardized by the well-publicized vulnerabilities of GNSS systems, and so using network distributed synchronization at least for backup is considered best practice. Metro or public access small cells present new challenges for synchronization. They require tight timing accuracy, but are often deployed in locations where adequate GNSS signal reception is not feasible: indoors, tunnels and urban canyons for example. TimeProvider 2300 is designed for cost-effective deployment at small cell aggregation sites. From this location most small cell backhaul links can support distribution of PTP timing to small cell base stations. Should the small cell backhaul links themselves include many hops or high packet delay variation (PDV), the problem can be solved by deploying an advanced boundary clock at selected small cell network nodes.

Protected Synchronization
As tighter synchronization becomes more essential to the normal operation of the network (Inter-Cell Interference Coordination, for example) the negative impact of losing synchronization becomes more significant. Rubidium oscillators provide a way to protect synchronization by delivering best-in-class holdover performance (phase timing of ±1.5 µsec for up to 24 hours). Often seen as expensive upgrades for individual macro base stations, rubidium oscillators in an advanced boundary clock are now more affordable as their cost is amortized across an entire cluster of small cells and co-located macro base stations.

TimeProvider 2300 Equipment
The TimeProvider 2300 PTP Boundary Clock provides two gigabit Ethernet interfaces in a combo port configuration supporting use of either copper or optical connections. They are configured as one PTP input port and one PTP output port. Synchronous Ethernet is supported on both ports. Models are available to support 8, 16, 32 or 64 PTP clients; all operating at the full 128 messages per second rate. Client capacity can be increased in the field with software license options. The TimeProvider 2300 is available with either an OCXO or rubidium oscillator; each delivering a different level of phase and frequency holdover performance and allowing operators to better optimize their network SLAs. The TimeProvider 2300 includes a programmable 10 MHz or 1 PPS BNC port and a PPS+TOD RS422 on an RJ45 connection. Models with either dual DC or a single AC power input are available. Using passive cooling, the TimeProvider 2300 has no fans.

TimeProvider 2300 Software License Options
Licensed software options for the TimeProvider 2300 include:

Greater client capacity: PTP client capacity in deployed units can be increased to 16, 32 or 64 clients, allowing network engineers to design for capacity they need today and be protected for increased requirements in the future.

E1/T1 Input/Output: The E1/T1 software option activates this port for use as either an input or output. As an input the signal provides a frequency reference to the clock function. As an output it can be used for synchronization of equipment using this established timing reference.

Default Profile: Enables layer 3 multicast capabilities for operation in additional network scenarios.

Deployment of 4G/LTE networks and small cells present new technical and economic issues for network planners and engineers. A major challenge is to meet stringent timing requirements over backhaul paths that were not originally designed to deliver synchronization at the level of accuracy needed. Upgrading the backhaul network or deploying GNSS receivers at every base station and small cell is often not possible for technical or economic reasons. A new type of synchronization equipment is needed: the TimeProvider 2300 PTP Boundary Clock and its companion product, the TimeProvider 2700 PTP Grandmaster, enable synchronization architectures that are more feasible for many network scenarios.
TimeProvider® 2300

Specifications

INTERFACES
1 AC power model, IEC 60320 C14 socket
1 DC power model, dual -48 VDC terminal block
1 Reset button
1 RS232 serial console port, (57,600 bps), DB9
1 Gigabit Ethernet – Management port
   - Shielded RJ45, 100/100 BaseT Ethernet
2 Gigabit Ethernet – PTP/ SyncE input and output combo ports
   - Shielded RJ45, 100/1000 BaseT Ethernet
   - SFP (optical), 1000 BaseX
   [Each port is configured as either as an input port (client) or an output port (master)]
1 T1 or E1 (optional), shielded RJ45
   - G.703/9, G.823/G.824 sync interface compliance
1 Time of Day (TOD) output port, RS422 Data (9600 Baud) with pulse per second (PPS) signal, shielded RJ45
1 10MHz or 1 PPS output port, BNC (f)
2 Grounding lugs

IEEE 1588-2008 PTP OUTPUT
• PTP output client capacity: 8, 16, 32 or 64 clients
• Up to 128 messages per second per client
• 1-step clock
• 2-step clock
• PTP profiles
   - ITU-T G.8265.1 (layer 3 unicast, IPv4)
   - Telecom-2008 Profile (layer 3 unicast, pre-standard ITU-T G.8265.1, IPv4)
   - Default Profile (layer 3 multicast, IEEE 1588-2008) (optional)
• VLAN (802.1Q, 802.1p)
• Best Master Clock Algorithm (BMCA), with Default Profile

IEEE 1588-2008 PTP INPUT
• Multi-sync function uses both PTP and a frequency input (SyncE or E1/T1)
• 1-step or 2-step clock
• Telecom-2008 Profile (layer 3 unicast, pre-standard ITU-T G.8265.1, IPv4)
• VLAN (802.1Q, 802.1p)

HOLDOVER PERFORMANCE

<table>

Holdover values are approximate and assume operation at constant temperature, no initial frequency or phase offset, and that the units has been powered on for 2 weeks and locked to PTP input for three consecutive days.

SYNCHRONOUS ETHERNET
• SyncE can be used as a frequency input or it can be generated as an output (as a master)
• Conforms to relevant sections of ITU-T G.8261, G.8262, and G.8264 Ethernet Synchronization Message Channel (ESMC)

NETWORK SUPPORT
• IPv4
• HTTP/HTTPS/SSL
• ICMP (RFC 792)
• DHCP Client (RFC2131)
• IEEE 1588-2008 Precision Time Protocol
• IEEE 802.1Q, 802.1p VLAN filtering/tagging
• DSCP

MECHANICAL
• Size: Height: 1.73 in. (44 mm); 1 RU
  Width: 17.24 in. (438 mm)
  Depth: 9.30 in. (237 mm)
  Depth: 10.07 in (256mm) – including connectors on faceplate
• Rack Mounts: 19 in. and 23 in. rack mount options
• Weight: AC power models: 7.5 lbs (3.4 kg)
  DC power models: 8.0 lbs (3.6 kg)

ENVIRONMENTAL
• Operating temperature
  - OCXO models: -40°C to +65°C, cold start at -20°C
  - Rubidium models: -5°C to +55°C
• Storage temperature: -40°C to +70°C
• Relative humidity: 5% to 95%

POWER
• DC power models: dual power feeds, -38.4 to -72 VDC
• AC power models: 90-264 VAC, 50/60 Hz
• Power consumption
  - OCXO model with DC supply: 20 Watts (max), 17 Watts (typical)
  - Rubidium model with DC supply: 28 Watts (max), 20 Watts (typical)
  - OCXO model with AC supply: 43 Watts (max), 37 Watts (typical)
  - Rubidium model with AC supply: 60 Watts (max), 43 Watts (typical)

EMC COMPLIANCE

ENVIRONMENTAL COMPLIANCE
• EN300-019-2-3, Class T3.2
• ETSI EN 300 019-2-2 (1999) – Transportation, Class T2.3
• ETSI EN 300 019-2-1 (2000) – Storage, Class T1.2
• RoHS (6 of 6)

NETWORK EQUIPMENT BUILDING SYSTEM
• NEBS Level 3*

*When following deployment guidelines as specified in the user manual.
Specifications

MANAGEMENT AND SECURITY
- TimePictra® Management System support
- SNMP v2c, v3 traps
- SYSLOG
- CLI, local (serial) and remote (telnet/SSH)
- Web interface (HTTP/HTTPS)
- Multi level user access
- Ability to disable management interfaces
- Remote software upgrade and rollback

MODELS and OPTIONS
- TimeProvider 2300 Edge Boundary Clock
  - 8 PTP client capacity, upgradable
  - Rack mount ears and screws
- Power supply models: AC or DC
- Oscillator models: OCXO or Rubidium
- SW license options
  - PTP client capacity upgrade: 16, 32 or 64 clients
  - Enable E1/T1 port
  - Enable PTP Default Profile (layer3 multicast)
- HW accessories (not included)
  - AC power cords
  - Ethernet optical SFP transceivers

Packet Delay Variation and Asymmetry
Timing and synchronization, fundamental in all mobile networks, is even more critical as small cells are added and networks evolve to LTE-TDD and LTE-A technologies. Backhaul network performance can dramatically impact PTP timing accuracy, and thereby the mobile network itself—affecting service quality and customer satisfaction.

The problem is Packet Delay Variation (PDV) which represents the change in latency from packet to packet. Packet delay itself has no effect on the accuracy of the clock: constant delay would allow an accurate time offset calculation by the PTP client. Variable delay, however, induces noise in the PTP client’s perception of the time at the master which can result in variation in time calculations based on the timestamps in the PTP packets.

Delay can vary as PTP packets are processed, buffered and queued along with the payload traffic through the network switches and routers, and it tends to be correlated to network load which can be highly asymmetric in nature. As the amount of traffic in the network increases, the delay variation is also likely to increase.

Time accuracy is affected by both the magnitude of this variation and how effective the client is at removing this noise. The TimeProvider 2300 incorporates Symmetricom’s advanced PTP client technology and a high quality reference oscillator. Advanced algorithms effectively filter this noise, allowing the timing signal at the base station to remain within specification.
